Sankey Diagrams for UCP Leadership Scenarios

I found @JLisaYoung's tweet about potential outcomes of the UCP leadership race fascinating and so I wanted to contribute. Here's a brief overview of the steps that I undertook, along with the results.

Data

I downloaded the data from the google sheet found here as an Excel workbook, removed all of the rows above the data on each sheet, tweaked the sheet names, and deleted the surprise plot twist (only because I didn't know how to visualize it, not because it didn't intrigue me).

For the "Base Model Declining Subsequent" sheet I deleted the "Adjusted Final" column as I wanted to be consistent with the prior columns in that sheet.

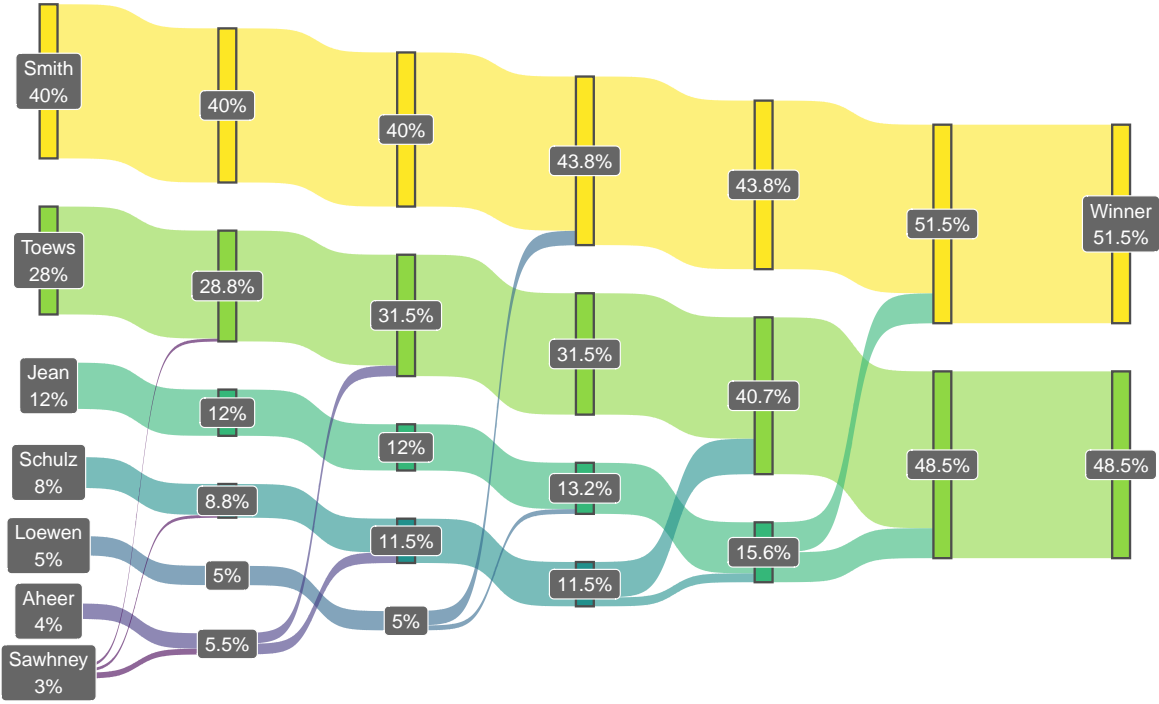

Processing and Visualizing

I wrote functions in R to read in the data and visualize it using David Sjoberg's **ggsankey** package (see here) for details. The functions I wrote are contained in the **HelperFunctions.R** file in my GitHub repo for this project.

Results

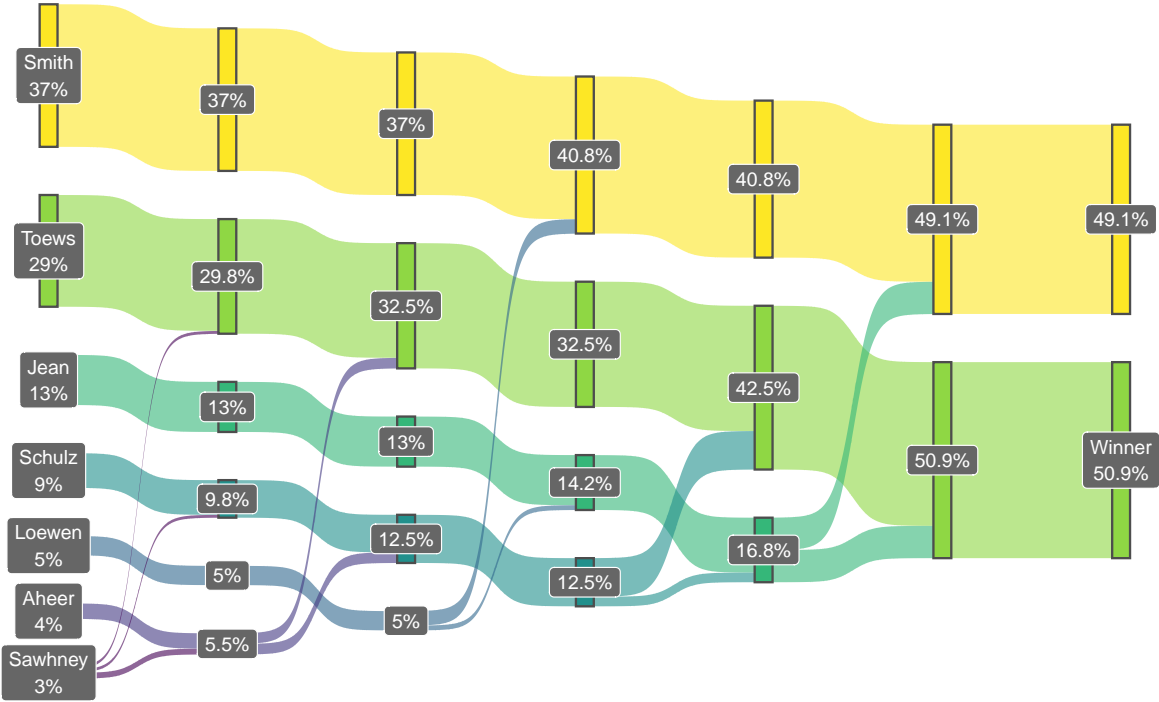

Here are the Sankeys that were obtained for each of the different scenarios listed:

Base Model
